

Amendments

This listing of claims will replace all prior versions, and listing. Of claims in the application:

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1-5 (Cancelled).

6. (Currently Amended) ~~A heat resistant flexible laminate obtained by the method for manufacturing a heat resistant flexible laminate comprising a step of laminating a heat resistant adhesive material and a metal foil by thermal lamination in a temperature range of not less than 200 degrees C, wherein a film-like protective material is disposed on the outside of the metallic foil between a pressurized surface and the metallic foil at the time of thermal lamination, and~~

a metallic foil having a coefficients of linear expansion defined as α_p ppm/degree C of the heat resistant adhesive material and the protective material in a temperature range of 200 degrees C to 300 degrees C and a heat resistant adhesive material are within a range of $\alpha_p \pm 10$ ppm/degree C, when having a coefficient of linear expansion within a range of $\alpha_p \pm 10$ by thermal lamination in a temperature range of not less than 200 degrees C, wherein a film-like protective material having a coefficient of linear expansion within a range of $\alpha_p \pm 10$ is disposed on the outside of the metallic foil between a pressurized surface and the metallic foil at the time of the thermal lamination, and

~~of the metallic foil is defined as α_m ,~~

wherein the metallic foil is a rolled copper foil or an electrolytic copper foil.

7. (Cancelled)

8. (Currently Amended) The method for manufacturing a heat resistant flexible laminate according to Claim 6,

wherein the film-like protective material is a heat resistant plastic film.

9. (Currently Amended) ~~A heat resistant flexible laminate obtained by the~~ The method for manufacturing a heat resistant flexible laminate comprising a step of laminating

~~a heat resistant adhesive material and a~~ metallic foil having a coefficient of linear expansion defines as $\alpha_s \pm 10$ ppm/degree C in a temperature range of 200 degrees C to 300 degrees C and a heat resistant adhesive material having a coefficient of linear expansion within a range of $\alpha_s \pm 10$

by thermal lamination in a temperature range of not less than 200 degrees C,

wherein a reusable film-like protective material having a coefficient of linear expansion within a range of $\alpha_s \pm 10$ is detachably secured to the outside of the metallic foil between a pressurized surface and the metallic foil at the time of thermal lamination, such that the protective material can be removed after lamination and re-used, and

~~coefficients of linear expansion of the heat resistant adhesive material and the protective material in a temperature range of 200 degrees C to 300 degrees C are within a range of $\alpha_s \pm 10$ ppm/degree C, when a coefficient of linear expansion of the metallic foil is defined as α_m ,~~ wherein the metallic foil is a rolled copper foil or an electrolytic copper foil.
